Height: 80 feet Spread: 10 feet Sunlight: O

Hardiness Zone: 8

Other Names: Washington Palm, Cotton Palm, Skyduster

## **Description:**

A towering palm that makes quite a focal point on the landscape; large fan like leaves emerge from a narrow trunk; spent leaves form a skirt around the trunk, and are a habitat for birds; largely cultivated as an ornamental palm; drought tolerant

## **Planting & Growing**

Mexican Fan Palm will grow to be about 80 feet tall at maturity, with a spread of 10 feet. It has a high canopy of foliage that sits well above the ground, and should not be planted underneath power lines. As it matures, the lower branches of this tree can be strategically removed to create a high enough canopy to support unobstructed human traffic underneath. It grows at a slow rate, and under ideal conditions can be expected to live for 80 years or more.

This tropical plant should only be grown in full sunlight. It is very adaptable to both dry and moist locations, and should do just fine under average home landscape conditions. It is considered to be drought-tolerant, and thus makes an ideal choice for xeriscaping or the moisture-conserving landscape. It is not particular as to soil type or pH. It is somewhat tolerant of urban pollution. This species is not originally from North America.

Mexican Fan Palm is a fine choice for the yard, but it is also a good selection for planting in outdoor pots and containers. Because of its height, it is often used as a 'thriller' in the 'spiller-thriller-filler' container combination; plant it near the center of the pot, surrounded by smaller plants and those that spill over the edges. It is even sizeable enough that it can be grown alone in a suitable container. Note that when grown in a container, it may not perform exactly as indicated on the tag - this is to be expected. Also note that when growing plants in outdoor containers and baskets, they may require more frequent waterings than they would in the yard or garden.
